Ethical Hacking Concepts and Practices

Topic: Simple Phishing Attack

Project Proposal

Simple Phishing Attack is entails a detail of capturing a username and password of an authorized person in an illegal way. Basically in this attack we build the clone of different webpages where our target visits the most like Facebook, Instagram, and other social engineering sites. This is also known as active attack.

In this Project:

1. We build a clone of a webpage.
2. Have database where we stored the credentials of our target data.
3. Capture the data and perform malicious activities by this.
